A food system is a system that includes all aspects of feeding a population. The production and sale of food makes up a significant part of India's economy, and India's food system has a strong effect on many facets of Indian life. For this project I investigated the various food systems for vegetables operating in and around the city of Pune, Maharashtra using experiential research, interviews, and secondary academic sources. This project presents what I have found to be the major aspects of the food system for vegetables in Pune and case studies of various alternative food systems in the area, as well as what I perceive to be the major problems in Pune's food systems and suggestions as to how these problems might be addressed.
